Sequential model enrichment under an exact zero rainfall effect
A. Accepted-event frequency
Events
B. Current apparent success
Success proportion
C. Mean simulated scenario price
Fixed-price baseline
Scenario units
D. Reputation and provider price heterogeneity
Reputation SD
Provider-mean-price SD
Provider price SD
E. Price(success) − price(failure)
Scenario units
F. Stock–flow interpretation
Past attributed outcomes
Reputation stock + current hazard
→ simulated scenario price
Current hazard → natural rainfall
→ current apparent success
No pseudo-event-to-rainfall effect
